### FIRMS' ROLLOVER RISK AND MACROECONOMIC DYNAMICS (Job Market Paper)

Presentations: Federal Reserve Board; NYU; Central Bank of Uruguay

*Abstract:* I analyze the aggregate implications of firms' rollover risk. I develop a heterogeneous firm macroeconomic model with rollover risk. Debt rollover problems arise when firms cannot repay outstanding debt because of coordination failures among their creditors. I assess the quantitative relevance of rollover problems by employing a model-based identification strategy which argues that the incidence of rollover problems is informed by the observed distribution of firms' bankruptcy outcomes. I find that around two thirds of bankruptcy events (liquidations and reorganizations) are due to rollover problems. I then use the model to assess the macroeconomic implications of rollover risk for the U.S. economy. I find that the presence of rollover problems can significantly amplify the impact of crises. Lastly, I show that imperfectly targeted credit policies deployed to mitigate rollover problems have a trade-off between less creditors' coordination failures in the short term and greater debt overhang in the future.
