WORKING PAPERS

QUANTIFYING FIRM RUNS (Job Market Paper)

Presentations: Federal Reserve Board; NYU; Central Bank of Uruguay

Abstract: I analyze the macroeconomic implications of firms' rollover problems (or firm runs). I develop a heterogeneous firm macroeconomic model with rollover risk. Rollover problems arise when firms cannot repay outstanding debt because of coordination failures among their creditors. I assess the quantitative relevance of firm runs by employing a model-based identification strategy which argues that the likelihood of runs is informed by the observed distribution of firms' bankruptcy outcomes. I find that rollover problems account for more than 60% of bankruptcy events. I then use the model to assess the macroeconomic consequences of firm runs and find that runs can significantly amplify the impact of crises. Lastly, I show that credit policies deployed to prevent rollover problems have a trade-off between lower incidence of runs in the short term and greater debt overhang in the future.
