WORKING PAPERS

FIRMS' ROLLOVER RISK AND MACROECONOMIC DYNAMICS (Job Market Paper)

Presentations: Federal Reserve Board; NYU; Central Bank of Uruguay

Abstract: This paper analyzes the macroeconomic implications of firms' rollover risk. I develop a heterogeneous-firms macroeconomic model with rollover crises emerging from coordination failures among creditors. Rollover crises are events in which a firm defaults because creditors fail to roll-over its debt, but would have repaid otherwise. I assess the quantitative relevance of rollover crises by employing a model-based identification strategy which argues that the incidence of rollover crises is informed by the observed distribution of firms' bankruptcy outcomes, and find that roughly half of the bankruptcy events are due to rollover crises. I validate the model using individual firms' observed investment dynamics during the last recessions and then use it to assess the aggregate implications of rollover risk for the U.S. economy. I find that rollover risk can significantly amplify the impact of recessions. Lastly, I show that imperfectly-targeted credit policies can mitigate debt rollover crises but exacerbate debt overhang in the future.
